

Dealing with waterlogged lawns and heavy soil

This guide is designed for gardens that sit wet for long periods.

1. First, understand where the water is coming from- Watch what happens during rain: is water running on from higher ground or hard surfaces?- Check downpipes, gullies and grids for blockages.- Note areas that are always wet versus those that only flood in extreme weather.
2. Simple short-term steps- Avoid using heavy machinery on soft ground.- Create temporary paths with boards or stepping stones where you must walk.- Lightly spike compacted areas using a fork (if the ground is firm enough to work safely).
3. When to plan proper drainage work- If water regularly sits on the surface for days at a time.- If sections of lawn cannot be used for long periods each year.- If nearby hard surfaces or slopes send most of their water towards the lawn.

Drainage improvements might include:- Re-shaping levels so water has somewhere sensible to go.- Installing land drains or soakaways where appropriate.- Changing lawn or planting layout in persistently wet zones.

We can put together a practical drainage and lawn plan for your specific garden, including phased work if you'd like to spread costs
